

ABSTRACT OF THE DISCLOSURE

A substrate carrying device is disclosed. The substrate carrying device, in cooperation with at least a substrate, comprises two end plates having a plurality of fixing holes and mounting holes, at least two partition
5 plates each having side faces, side edges and a plurality of parallel slots wherein the parallel slots are formed on each side face of the partition plate to receive the substrate, a plurality of assembling units, a plurality of fixing poles having binding holes, and at least a bottom rail having a plurality of
fixing pins. The substrate carrying device is capable of strengthening the
10 structure of the device, protecting the substrates, simplifying adjustment of the size of the device, and facilitating draining and stacking.
